Projects

We are volunteers who are already working professionally in the software industry. We came together to develop open-source technologies for the use of official institutions and non-governmental organizations after the earthquake that occurred in Kahramanmaraş and affected 10 provinces.

Our call on our social media networks, where we already share a lot professionally, quickly echoed and thousands of professionals volunteered to join the project as experts in their fields. We stayed in touch with many official institutions and non-governmental organizations such as AFAD, AHBAP, and AKUT, and acted as an external service provider to offer technologies that can solve crucial problems after the earthquake. We received support from many corporate firms in terms of personnel and infrastructure.

Currently, over 23,000 volunteer software industry employees on our Discord server are developing end-to-end field support systems that can help in case of any disaster as open-source. You can access the technologies developed by independent volunteers as open-source for the use of official institutions and non-governmental organizations before, during, and after disasters on the website.
